J. Bacteriol. 170:2668-2675(1988).
I- CATALYTITY: NADPH + quinone = NADP(+) + semiquinone.
I- SUBUNIT: Homodimer (By similarity).
I- SUBUNIT: Belongs to the zino-containing alcohol dehydrogenase family. Quinone oxidoreductase subfamily.
                                                                Gaps

I. Biol. Chem. 271:1166-1173(1996).

can bind two atoms of ferric iron in association with the binding of an anion, usually bicarbonate. It is responsible for the transport of iron from sites of absorption and heme degradation to those of storage and utilization. Serum transferrin may also have a further role in stimulating cell proliferation.

SUBCELLULAR LOCATION, Secreted.

SUBCELLULAR LOCATION, Secreted.

TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma.

DOMAIN: Composed of two homologous domains.

SIMILARITY: Belongs to the transferrin family.

similarity).
-!- COFACTOR: Zinc (Probable).
-!- SUBCELULAR LOCATION: Integral membrane protein. Inner membrane (By similarity).
-!- SIMILARITY: Belongs to peptidase family M50B.
-!- SIMILARITY: Contains 1 PDZ/DHR domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacteria; Proteobacteria, Gammaproteobacteria, Enterobacteriales,

"Purification of two chitinases from Rhizopus oligosporus and isolation and sequencing of the encoding genes.";
J. Bacteriol. 174:7389-7406(1922).
-!- FUNCTION: Probably involved in the apical growth and branching of fungal hyphae.
-!- CATALWITC ACTIVITY: Hydrolysis of the 1,4-beta-linkages of N-acetyl-D-glucosamine polymers of chitin.
-!- SUBCELLUIAR LOCATION: Secreted (Probable).
-!- SUBCELLUIAR LOCATION: Secreted (Probable).
-!- FIM: O-glycosylated.
-!- SIMILARITY: Belongs to chitinase class II (family 18 of glycosyl hydrolases).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

-!- FUNCTION: The steroid hormones and their receptors are involved in the regulation and differentiation in target tissues.

-!- SUBCELULIAR LOCATION: Nuclear.
-!- SUBCELULIAR LOCATION: Nuclear.
-!- DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.
-!- SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  C4-TYPE.

Requiation of the progesterone receptor gene by gonadotropins and cyclic adenosine 3'.5' -monophosphate in rat granulosa cells.";
Endocrinology 134:709-718(1994).
In FUNCTION: The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.
In SUBCELLULAR LOCATION: Nuclear.
In DOWAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.
In SUMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    C4-TYPE.

"Three alternatively spliced variants of the gene coding for the human
bone morphogenetic protein-1.";
J. Mol. Med. 76:141-146(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         COFACTOR: Binds 1 zinc ion per subunit (By similarity).
ENZYME REGILATION: Activity is increased by the procollagen C-
endopeptidase enhancer protein.
ALTERNATUE RODUCTS:
EVENT-Alternative splicing; Named isoforms=7;

BIZYME RESULATION: Activity is increased by the procollagen C-
endoperidase enhancer protein.

TISSUE SPECIFICITY: At high levels in embryonic maternal deciduum
and floor plate region of the neural tube. Less in developing
membranous and endochondral bone, submucosa of intestine, dermis
of skin and the mesenchyme of spleen and lung.

SIMILARITY: Centains 2 EGF-like domains.

SIMILARITY: Contains 5 CUB domains.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention relates to Mycobacterium tuberculosis (Mtb) vaccine acadidate peptides. The invention also relates to a method for the invention also relates to a method for the invention which vaccine candidate peptides as well as vaccines comprising these candidate peptides. Vaccines of the invention and Mtb vaccine tuberculosis (anti-Mtb) inmune response by raising anti-Mycobacterium mammalian subject preferably humans. They are used for immunising a mammalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis. The present sequence is a Mtb vaccine candidate peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New vaccine for immunizing a mammalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis.
                                                                                                                                                             Mycobacterium tuberculosis, Mtb peptide; antibacterial; vaccine; infection; anti-Mtb immune response.

The invention describes a method of inducing type 1/T-helper-1 T-cell response or interleukin-12 (IL-12) in a cell involves administration of a lipopeptide (1) having an N-terminal ester- or amide-linked fatty acyl group. The methods are used to stimulate cell-mediated immunity for prevention and treatment of pathogen infections (e.g. Mycobacterium tuberculosis) and for treatment of a interferon-gamma sensitive tumour. Also useful in the development of new vaccine and therapeutic strategies. This is the amino acid sequence of Mycobacterium tuberculosis 38kDa protein from which lipopeptides can be isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inducing interleukin-12 and type 1/T-helper-1 T-cell response to stimulate cell-mediated immunity for preventing and treating pathogen infection involves administering lipopeptide having N-terminal ester- or amide-linked fatty acyl group.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of inducing type 1/T-helper-1 T-cell response or interleukin-12 (IL-12) in a cell involves administration of a lipopeptide (I) having an N-terminal ester- or amide-linked fatty acyl group. The methods are used to stimulate cell-mediated immunity for prevention and treatment of pathogen infections (e.g. Mycobacterium tuberculosis) and for treatment of a interferon-gamma sensitive tumour. Also useful in the development of new vaccine and therapeutic strategies. This is the amino acid sequence of mature Mycobacterium tuberculosis 38kDa protein from which lipopeptides can be isolated

They have excellent sensitivity and improved specificity to PpD-tuberculin. They fail to provoke a strong immune response in delayed-type hypersensitivity or lymphocyte activation tests in patients with pulmonary and non-lymphatic extrapulmonary TB. This provides the basis of distinguishing TB patients from these patients. Diagnosing TB comprises either intradernal injection of the peptide, or contacting lymphocytes

This polypeptide comprises a fusion protein composed of Mycobacterium tuberulousis antigens Thais (see AAM64295); 38 Kba antigen (see AAM64364) and Tb38-1 (see AAM64321). It was produced by PCR amplification (see AAM644321). It was produced by PCR amplification (see AAW44407-12) of the appropriate antigen DNA sequences (see AAV44413) and cloning into an expression vector. The fusion protein was expressed in E. coli. It can be used for serodiagnosis of tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. It portion of a polypeptides (see AAM64291-W64399) comprising an antigenic portion of a soluble M. tuberculosis antigen, an immunogenic portion of an M. tuberculosis antigen, or a fusion protein, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transfected host calls. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated Mycobacterium tuberculosis polypeptides and DNA - used develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tuberculosis; infection; diagnosis; 38 kDa antigen; TbRa3; Tb38-1.

                                                                                                                                                                                                                                                                                                The sequence is that of the 38 kDa lipoprotein antigen of Mycobacterium tuberculosts, from this peptides can be derived which can be used in place of the purified protein derivative (PPD) test. The peptides can be used to diagnose tuberculosis (TB) in a human or non-human animal, and to distinguish a TB patient from an infected or otherwise sensitised but healthy clinical suspect. They stimulate lymphocytes which have been sensitised to antigens of M. tuberculosis. The peptides may be used in in vivo skin thests relying on delayed hypersensitivity reaction causing reddening and swelling, or in ex vivo detection of activated lymphocytes. They have excellent sensitivity and improved specificity to PPD.

                                                                                                                                                                                                                                                                                                                                                                                                                      This polypeptide comprises Mycobacterium tuberculosis 38 kDa antigen. A This 3-38 kD-Tabal-1 fusion protein (see AAM64361) has been constructed that can be used in the serolagnosis of tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. In provides polypeptides (see AAM64291 W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, an immunogenic portion of an M. tuberculosis antigen, an immunogenic portion of an M. tuberculosis antigen, recombinant expression vectors and encoding such polypeptides, recombinant expression vectors and diagnostic kits for detecting M. tuberculosis infection in a patient
                                                                                                                                                                                                                                                                                                                                                           New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tuberculosis; immunogenic; soluble; antigen; protective immunity; TB;

This sequence represents a fusion protein containing the immunogenic polypeptides TbRa3, 38kD and Tb38-1 from Mycobacterium tuberculosis (MT). This fusion protein can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of TB
                                                                                                                                                                                                                                                                                                                                                                                                Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tuberculosis, immunogenic, soluble, antigen, protective immunity, TB; vaccine, pharmaceutical, infection, diagnosis.

of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein components

```
This sequence represents a 38kD antigen from Mycobacterium tuberculosis (MT). This antigen can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of TB
                                                                                                  Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.
                                                                                                                                                                                   Claim 23; Page 159-160; 230pp; English

Claim 1; Fig 3A-D; 83pp; English

This sequence represents a recombinant Mycobacterium tuberculosis triantigen fusion protein composed of the antigens TDRa3, 39kD and TD38-1. The fusion protein is expressed in host cells using a vector carrying a polynucleotide (see AAZ20196) comprising the 3 coding sequences for the antigens. The invention provides fusion proteins (see AA332059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polynucleotides encoding them are useful as vaccines for proteins tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments. can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by. T., B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AA219249 to AA219460 and AA39083 to AA39225 are used in the exemplification of
                                                                                                                             New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

une present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. DAAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cyrokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19249 to AAZ19460 and AAX39083 to AAX39225 are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of polypeptide comprising CD8 T-cell epitopes derived from Mycobacterium tuberculosis proteins in the manufacture of a medicament for vaccinating prophylactically or therapeutically against mycobacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to use of polypeptides comprising CD8 T-cell epitopes derived from Mycobacterium tuberculosis proteins. The invention is useful in the manufacture of a medicanal for prophylactic or therapeutic vaccination against mycobacterial infection. The polypeptide and the expression vector are capable of stimulating CD8 T-cell response. The invention also provides a vaccine composition which comprises polypeptide or expression vector useful for vaccinating a pre-selected host against a mycobacterial infection. The invention further relates to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    38xDa-LP protein, antibiotic, vaccine; CD8 T-cell, epitope, medicament, prophylactic, therapeutic, mycobacterial infection.
  New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous bolynucleocide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleocide sequence encoding a polypeptide or its fragment. The Leishmania polynucleocide is selected from TSA, LeIF, MIS, and 6 H polynucleocides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic
a method for determining the presence or absence of CD8 T-cell response to epitope sequence by dentifying the presence or absence of T-cell that recognise the epitope sequence in a sample from the host. The present sequence is Mycobacterium tuberculosis 38kDa-LP protein related to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynucleotide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.

```
microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is Mycobacterium sp. 38kb antigenic protein

NSOUL 19. 49. Application US/0981333

Sequence 49, Application US/0981333

Patent No. US20020119160A1

SEQUENCE 41. AD 19. Application US/09813333

APPLICANT: DeGroot, Anne S

TITLE OF INVENTION: Human T Cell Response to MHC-Binding Motif Clusters

FILE REPERENCE: 17999-004 US

CURRENT PILING DATE: 2001-03-20

PRIOR APPLICATION NUMBER: 60/190,834

PRIOR APPLICATION NUMBER: 60/190,834

PRIOR PILING DATE: 2000-03-20

NUMBER OF SEQ ID NOS: 81

SOUTHWAR: Patentin Ver. 2.1

SEQ ID NO 49

LENGTH: 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US-10-044-703-49

| Sequence 6, Application US/09287849
| Patent No. US20020009459A1
| GENERAL INFORMATION:
| APPLICANT: Reed, Steven 6, | APPLICANT: Billon, Davin C. | APPLICANT: Alderson, Mark
| APPLICANT: Compos-Neto, Antonio | APPLICANT: Compos-Neto, Antonio | APPLICANT: Compos-Neto, Antonio | APPLICANT: Compos-Neto, Antonio | APPLICANT: Compos-Neto, Antonio | APPLICANT: Compos-Neto, Antonio | APPLICANT: Compos-Neto, ANTONION: and Their Uses | ITILE OF INVENTION: UMBER: US 09/287,849 | CURRENT APPLICATION NUMBER: US 08/818,112 | PRIOR PRILING DATE: 1997-10-01 | PRIOR PRILING DATE: 1997-10-01 | PRIOR PRILING DATE: 1998-02-18 | PRIOR FILING DATE: 1998-0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APPLICANT: Corixa Corporation
TITLE OF INVENTION: Fusion Protiens of Mycobacterium tuberculosis Antigens
TITLE OF INVENTION: and Their Uses
FILE REFERENCE: 014058-009020UG
CURRENT APPLICATION NUMBER: US/09/287,849
CURRENT FILING DATE: 1999-04-07

The present invention relates to Mycobacterium tuberculosis (Mtb) vaccine candidate peptides. The invention also relates to a method for the invention also relates to a method for the invention Mtb vaccine candidate peptides as well as vaccines comprising these candidate peptides. Vaccines of the invention and Mtb vaccine candidate peptides are useful for inducing an anti- Mycobacterium tuberculosis (anti-Mtb) immune response by raising anti-Mtb antibody in a mammalian subject preferably human. They are used for immunising a mammalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis. The present sequence is a Mtb vaccine candidate peptide

                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to Mycobacterium tuberculosis (Mtb) vaccine candidate peptides. The invention also relates to a method for identifying Mtb vaccine candidate peptides as well as vaccines comprising these candidate peptides. Vaccines of the invention and Mtb vaccine candidate peptides are useful for inducing an anti- Mycobacterium ruberculosis (anti-Mtb) immune response by raising anti-Mtb antibody in a mammalian subject preferably humans, against infection caused by Mycobacterium tuberculosis. The present sequence is a Mtb vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention describes a method of inducing type 1/T-helper-1 T-cell response or interleukin-12 (IL-12) in a cell involves administration of a lipopeptide (I) having an N-terminal ester- or amide-linked fatty acyl group. The methods are used to stimulate cell-mediated immunity for prevention and treatment of pathogen infections (e.g. Mycobacterium tuberculosis) and for treatment of a interferon-gamma sensitive tumour. Also useful in the development of new vaccine and therapeutic strategies. This is the amino acid sequence of mature Mycobacterium tuberculosis 38kDa protein from which lipopeptides can be isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inducing interleukin-12 and type 1/T-helper-1 T-cell response to stimulate cell-mediated immunity for preventing and treating pathogen infection involves administering lipopeptide having N-terminal ester- or amide-linked fatty acyl group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

                                                                                                                                                                                                                      The invention describes a method of inducing type 1/T-helper-1 T-cell response or interleukin-12 (IL-12) in a cell involves administration of a lipopeptide (I) having an N-terminal ester or anide-linked fatty acyl group. The methods are used to stimulate cell-mediated immunity for prevention and treatment of pathogen infections (e.g. Mycobacterium tuberculosis) and for treatment of a interferon-gamma sensitive tumour. Also useful in the development of new vaccine and therapeutic strategies. This is the amino acid sequence of Mycobacterium tuberculosis 38kba protein from which lipopeptides can be isolated
                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                           Inducing interleukin-12 and type 1/T-helper-1 T-cell response to stimmlate cell-mediated immunity for preventing and treating pathogen infection involves administering lipopeptide having N-terminal ester- or amide-linked fatty acyl group.
                                                                                                                                                                                                                                                                                                                                                      Gaps

The sequence is that of the 38 kDa lipoprotein antigen of Mycobacterium tuberculosis, from this peptides can be derived which can be used in place of the purified protein derivative (PPD) test. The peptides can be used to diagnose tuberculosis (TB) in a human or non-human animal, and to distinguish a TB patient from an infected or otherwise sensitised but healthy clinical suspect. They stimulate lymphocytes which have been sensitised to antigens of M. tuberculosis. The peptides may be used in in vivo skin tests relying on delayed hypersensitivity reaction causing reddening and swelling, or in ex vivo detection of activated lymphocytes. They have excellent sensitivity and improved specificity to PPD-tuberculin. They fail to provoke a strong immune response in delayed-type hypersensitivity or lymphocyte activation tests in patients with confinency and non-lymphatic extrapulmonary TB. This provides the basis of collinguishing TB patients from these patients. Diagnosing TB comprises either intradernal injection of the peptide, or contacting lymphocytes with the peptide. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide(s) from mycobacterium tuberculosis antigens - useful for the diagnosis of tuberculosis.

This polypeptide comprises a fusion protein composed of Mycobacterium tuberculosis antigens TbRa3 (see AAW64295), 38 kDa antigen (see AAW64364) and TD38-1 (see AAW64301). It was produced by PCR amplification (see AAW4407-12) of the appropriate antigen DNA sequences (see AAW44413) and cloning into an expression vector. The fusion protein was expressed in Exelects to compositions and methods for diagnosing tuberculosis. The invention provides polypeptides (see AAW64291-W64379) comprising an antigenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               portion of a soluble M. tuberculosis antigen, an immunogenic portion of an M. tuberculosis antigen, or a fusion protein, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and
                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated Mycobacterium tuberculosis polypeptides and DNA - used develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient
                                                                                      Tuberculosis; infection; diagnosis; 38 kDa antigen; TbRa3; Tb38-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 81; DB 2; Length 374; 100.0%; Pred. This polypeptide comprises Mycobacterium tuberculosis 38 kDa antigen. A Thisa-38 kD-Tabal-1 fusion protein (see AAM64363) has been constructed that can be used in the serodiagnosis of tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAM64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, an immunogenic portion of an M. tuberculosis antigen, an fusion protein, as well as DNA sequences conciding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient
                                                                                                                                                                                                                                                       New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tuberculosis, immunogenic, soluble, antigen, protective immunity, TB; vaccine, pharmaceutical, infection, diagnosis.

Sequence 374 AA;

g

```
This sequence represents a fusion protein containing the immunogenic polypeptides TbRa3, 38kD and Tb38-1 from Mycobacterium tuberculosis (MT). This fusion protein can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of TB
                                                                  Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tuberculosis; immunogenic; soluble; antigen; protective immunity; TB; vaccine; pharmaceutical; infection; diagnosis.

```

This sequence represents a 38kD antigen from Mycobacterium tuberculosis (MT). This antigen can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of TB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a recombinant Mycobacterium tuberculosis trianatigen fusion protein composed of the antigens TDR33, 39kD and TD38-1. The fusion protein is expressed in host cells using a vector carrying a polynucleotide (see AAZ0196) comprising the 3 coding sequences for the antigens. The invention provides fusion proteins (see AAX32059-71) antigens. The invention provides fusion proteins (see AAX32059-71) and polynucleotides encoding them are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal with rests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein components
                                                                                                                                                                                                                                                                                                    Tuberculosis; antigen; fusion protein; TbRa3; 38kD; Tb38-1; diagnosis;

nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                 Antigen; diagnosis; detection; infection; antibody; immunisation; vaccine; immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antigen; diagnosis; detection; infection; antibody; immunisation;
                                                                                                                                                                                                                                                                                                                                                  New polypeptide comprising antigenic portions of M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel recombinant antigens and their

                                                                                                                                                                                                    This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes polypeptides comprising an immunogenic

vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-inmune subjects. AAZ19460 and AAX194083 to AAX19450 are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. On tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce profiferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AZ219249
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of polypeptide comprising CD8 T-cell epitopes derived from Mycobacterium tuberculosis proteins in the manufacture of a medicament for vaccinating prophylactically or therapeutically against mycobacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to use of polypeptides comprising CDB T-cell epitopes derived from Mycobacterium tuberculosis proteins. The invention is useful in the manufacture of a medicament for prophylactic or therapeutic vaccination against mycobacterial infection. The polypeptide and the expression vector are capable of stimulating CDB T-cell response. The invention also provides a vaccine composition which comprises polypeptide or expression vector useful for vaccinating a pre-selected host against a mycobacterial infection. The invention further relates to a method for determining the presence or absence of CDB T-cell response to epitope sequence by identifying the presence or absence of T-cell that recognise the apitope sequence in a sample from the host. The present sequence is Mycobacterium tuberculosis 38kDa-LP protein related to the
                                                                                                                                                                                                                                                                                                                            38kDa-LP protein; antibiotic; vaccine; CD8 T-cell; epitope; medicament; prophylactic; therapeutic; mycobacterial infection.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

0584
osphate specific transporter S precursor - Mycobacterium tuberculosis (strain H37RV)
Alternate names: antigen b
Species: Mycobacterium tuberculosis
Date: 10-Sep-1999 #sequence revision 10-Sep-1999 #text change 16-Jun-2000
Accession: F70584; JC5103; A42930; A49721; A45820
